A contrastive study of Spanish-Chinese intra-sentence discourse structures based on the discourse marker “although”

Un estudio contrastivo de las estructuras discursivas intraoracionales en español y en chino basado en el marcador discursivo “aunque”

Abstract: The translation between Spanish and Chinese is particularly complicated because of the extensive grammatical, syntactic and discursive differences between the two languages. In this paper, based on the discourse marker in Spanish ‘although’, which signals the Concession relation, we will compare the discourse structure of Spanish and Chinese in the parallel corpus United Nations Corpus (UN). For realizing the comparison, we will use the theoretical framework of Rhetorical Structure Theory (RST) by Mann and Thompson (1988).

Keywords: discourse analysis, translation, discourse marker, RST, parallel corpus

Resumen: La traducción español-chino es especialmente complicada debido a las grandes diferencias gramaticales, sintácticas y discursivas entre ambas lenguas. En este trabajo, comparamos las estructuras discursivas del español y el chino en el corpus paralelo United Nations Corpus (UN), partiendo del marcador discursivo en español aunque, que refleja la relación de Concesión. Para realizar la comparación empleamos el marco teórico de la Rhetorical Structure Theory (RST) de Mann y Thompson (1988).

Palabras clave: análisis del discurso, traducción, marcador discursivo, RST, corpus paralelo

1 Introduction

The greater the distance is between a pair of languages, the greater the number of differences in their syntax and discourse structure. Therefore, the translation between two very different languages can be potentially more difficult. Comparative or contrastive studies of discourse structures offer clues to identify properly equivalent discourse elements in two languages. These clues can be useful for both human and machine translation (MT).

The emphasis on the idea that discourse information may be useful for Natural Language Processing (NLP) has become increasingly popular. Discourse analysis is an unsolved problem in this field, although discourse information is crucial for many NLP tasks (Zhou et al., 2014). In particular, the relation between MT and discourse analysis has only recently begun and works addressing this topic remain limited. A shortcoming of most of the existing systems is that discourse level is not considered in the translation, which therefore affects translation quality (Mayor et
al., 2009; Wilks, 2009). Notwithstanding, some recent researches indicate that discourse structure improves MT evaluation (Fomicheva, da Cunha and Sierra 2012; Tu, Zhou and Zong, 2013; Guzmán et al., 2014).

The studies that use Rhetorical Structure Theory (RST) by Mann and Thompson (1988) as framework are a contribution to discourse analysis research. RST is a theory that describes text discourse structure in terms of Elementary Discourse Units (EDUs) (Marcus, 2000). Relations are recursive in RST and are defined to hold between EDUs; these EDUs can be Nuclei or Satellites, denoted by N and S (Satellites offer additional information about Nuclei). The relations can be Nucleus-Satellite (e.g. Cause, Result, Concession, Antithesis) or Multinuclear (e.g. List, Contrast, Sequence).

RST is appropriate for our research because of the following reasons:

1) RST is one of the most famous and representative discourse structure theories. It shows a good applicability in a cross-cultural comparative study. As Mann and Thompson declare (1988: 247):

RST is an abstract set of conventions. We can view the conventions as either independent or inclusive of particular relation definitions. The first view is more comprehensive, but the latter is more convenient - we use the latter. The first view would be essential for a cross-linguistic or cross-cultural comparative study in which relation definitions might differ.

Our research is comparative and focuses on a parallel Spanish-Chinese corpus, which corresponds to the above citation.

2) The set of relations proposed in the framework of RST is representative for the analysis of the discourse of any field or text genre (Mann and Thompson, 1988). The investigation targets of our work are Spanish and Chinese written texts that contain many different subjects or themes.

3) In a contrastive study, the RST elements (segments, relations and discourse structure) can reveal how the discourse elements are being expressed formally in each language. This could reflect the similarities and differences of the rhetorical structure of the language pair. In turn, this may help us to elaborate some guidelines that include discourse similarities and differences for human and machine translation (MT) between the language pair Chinese-Spanish.

Based on the Spanish discourse marker aunque, here are two example of discourse similarities and differences between Spanish and Chinese.

Ex. 1:
1.1. Ch: 虽然他病得很重，但是他去上班了。[虽然他病得很重，EDU_S [但是他去上班了。]EDU_N (Marker_1 he ill very, marker_2 he goes to work.)
1.2. Sp: Aunque está muy enfermo, va a trabajar. [Aunque está muy enfermo,EDU_S [va a trabajar.]EDU_N (Marker_1 is very ill, goes to work.)
1.3. En: Though he is very ill, he goes to work.2

In example 1, Chinese and Spanish passages show the same rhetorical relation (Concession), and the order of the Nucleus and the Satellite is also similar. However, in Chinese, it is mandatory to include two discourse markers to show this relation: one marker “suiran” (虽然) at the beginning of the Satellite and another marker “danshi” (但是) at the beginning of the Nucleus. These two discourse markers are equivalent to the English discourse marker although. By contrast, in Spanish, to show the Concession relation, only one discourse marker is used at the beginning of the Satellite (in this case, aunque, ‘although’).

Ex. 2:
2.1. Ch: 很冷，虽然没有下雨。[很冷，]EDU_S [雖然没有下雨。]EDU_N (It’s cold, marker_1 there is no rain.)
2.2.1 Sp: Hace frio, aunque no llueve. [Hace frio,]EDU_N [aunque no llueve.]EDU_S (Makes cold, marker_1 no rain.)
2.2.2 Sp: Aunque no llueve, hace frio.

1 In this work, we offer an English literal translation in brackets for the first two examples in order to understand each example better.
2 In this work, for all the examples we give, all the English translations are translated from the Spanish sentences by the authors.
2.3. En: It is cold, **though** there is no rain.

In example 2, the Chinese passage could have the same or the different rhetorical structure. In the Chinese passage, the discourse marker “**suiran**” (虽然) at the beginning of Satellite, which is equivalent to the English discourse marker **although**, shows a Concession relation, and the order between Nucleus and the Satellite cannot be changed. In the Spanish passage, “**aunque**” is also at the beginning of Satellite, which also corresponds to the English discourse marker **although**, and shows the same discourse relation, but the order between Nucleus and Satellite can be changed and this makes sense syntactically.

From the examples above, we can see that with the Spanish discourse marker **aunque**, for expressing a Concession relation in a written text, the rhetorical structure between Chinese and Spanish can be the same, but the number of discourse markers is different. Moreover, under a same RST relation, the rhetorical structure between these two languages can be different or same, but the number of discourse markers is same.

Taking into account discourse information when a translation is carried out is necessary for a good quality of the translation.

Based on the Spanish discourse marker **aunque** (‘although’ in English), which shows the Concession relation, we will compare the discourse structure of Spanish and Chinese in the parallel corpus United Nations Corpus (UN) (Rafalovitch and Dale, 2009; Eisele and Chen, 2010).

In Section 2, we will introduce some related works that use RST. In Section 3, we will give the detail information of the methodology. In Section 4, we will establish the results. In Section 5, we will conclude the research information and look ahead at future work.

2 Related Work

Thus far there have not been many studies addressing discourse analysis relating to our subject of study. Yet some comparative studies between Chinese and English by employing RST exist. Cui (1986) presents some aspects regarding discourse relations between Chinese and English; Kong (1998) compares Chinese and English business letters; Guy (2000, 2001) compares Chinese and English journalistic news texts.

Other pairs of language within RST include Japanese and Spanish (Kumpf, 1986; Marcu et al., 2000), Arabic and English (Mohamed and Omer, 1999), French and English (Delin, Hartley and Scott, 1996; Salkie and Oates, 1999), Dutch and English (Abelen, Gisla and Thompson, 1993), Finnish and English (Sarjala, 1994), Spanish and Basque (da Cunha and Iruskieta, 2010).

There are few contrastive works between Spanish and Chinese. None of them use RST. Yao (2008) uses film dialogues to elaborate an annotated corpus, and compares the Chinese and Spanish discourse markers in order to give some suggestions for teaching and learning Spanish and Chinese. In this work, Yao does not use any framework clearly; he just analyses and compares Spanish and Chinese discourse markers’ characteristics and then makes conclusions. Taking different newspapers and books as the research corpus, Chien (2012) compares the Spanish and Chinese conditional discourse markers to give some conclusions on the conditional discourse marker for foreign language teaching between Spanish and Chinese. Wang (2013) uses a corpus of films to analyse how the subtitles Spanish discourse markers can be translated into Chinese, so as to make a guideline for human translations and audiovisual translation between the language pair.

The RST contrastive studies that use more than two languages are not common, for example, Portuguese-French-English (Scott, Delin and Hartley, 1998). In this work, a methodology has been presented for RST contrastive analysis while the empirical cross-lingual results have been published. Iruskieta, da Cunha and Taboada (2015) use RST as theoretical framework to compare Basque, Spanish and English, so as to create a new qualitative method for the comparison of rhetorical structures in different languages and to specify why the rhetorical structure may be different in translated texts.

3 Methodology

As the previous examples show, discourse similarities and differences exist between the Spanish sentences that contain the discourse marker **aunque** and their Chinese translated sentences. For this study, we have adopted the
UN corpus as the research corpus. This corpus contains all 6 languages (English, Chinese, Spanish, Arabic, Russian and French) of the UN, consisting of around 300 million words for each language. Recorded in March of 2010, this corpus consists of 463,406 documents, 80,931,645 sentences in total. 326 million words have been calculated as the average number for five of the six official languages.

Table 1 shows the detail information of the UN corpus, and its subcorpus in Spanish and in Chinese.

![Table 1: Statistics of the Spanish and Chinese subcorpora](image)

In this research, we have adopted 4 million Spanish words as the study sample. We have extracted all the Spanish sentences (including repeated sentences) that contain the discourse marker aunque and all their Chinese parallel sentences manually. Then, we have carried out the RST analysis of these sentences manually. See for example Figure 1.

(English translation: Although the environment has become more conducive to some reconstruction and development in some areas of the country, the humanitarian and security situation has remained precarious in others.)

Figure 1. Example of RST analysis of a Spanish and Chinese sentence from the corpus by using the RSTTool interface (O’Donnell, 1997)

Finally, we have compared the Spanish sentences and the parallel Chinese sentences through: discourse segmentation, RST relations, nuclearity order and discourse marker.

In this work, we followed the segmentation criteria proposed by Iruskieta, da Cunha and Taboada (2015) for both Spanish and Chinese. We use the relations established by Mann and Thompson (1988) and the relation of Same-unit mentioned by Carlson, Marcu and Okurowski (2001) to define the relations between the EDUs. We use discourse markers to detect the different discourse relations between EDUs and to decide the EDUs to be the Nucleus or the Satellites, and the nuclearity order.

4 Results

Among the 4 million Spanish words, we have obtained 99 Spanish sentences that contain the discourse marker aunque. However, not all the 99 sentences are different: we find 13 repeated sentences. Therefore, 86 sentences are included in the results. Table 2 includes a sample of our database.

![Table 2: Example of the parallel sentences included in the analysis](image)
As previously mentioned, the discourse marker *aunque* in Spanish shows the Concession relation. In its parallel Chinese corpus, *aunque* presents the following translation cases. There are 47 independent Chinese sentences that hold the Concession relation. For showing the Concession in its parallel Chinese corpus, *aunque* has been translated into 5 different Chinese discourse markers, which are formed by two words, as “suiran...danshi” (虽然...但是), “suiran...dan” (虽然...但), “jinguan...danshi” (尽管...但是), “jishi...reng” (即使...仍), “suiran...que” (虽然...却), “sui...er” (虽...而), “jishi” (即使) and “jinguan” (尽管).

For the case of the two discourse markers, they have the same meaning, and are equivalent to the English discourse marker ‘although...but’. In this case, it is mandatory to include two discourse markers to show the Concession relation: one marker at the beginning of the Satellite and another marker at the beginning of the Nucleus. In the case of two discourse markers, the rhetorical structure of Chinese sentences is S-N. For the case of one discourse marker, these discourse markers are equivalent to English discourse ‘although’, and in the Concession relation, it is obligated to put them at the beginning of the Satellite, the rhetorical structure is N-S.

In Spanish, for expressing a Concession relation, the order of Nucleus and Satellite can change and it does make sense syntactically. Therefore, in UN corpus, for the Concession relation case, the rhetorical structure between Spanish and Chinese is similar; it depends on how many Chinese discourse markers have been used in the translation.

Apart from indicating the Concession relation, there are some other special translations to Chinese of the sentences including *aunque* in Spanish:

1) There are 22 Chinese sentences that comprise the Antithesis relation. In Antithesis relation, *aunque* has been translated to “dan” (但), “sui” (虽), and “er” (而). All these Chinese discourse markers carry the same meaning and are equivalent to ‘but’ in English. The number of discourse markers between Spanish and Chinese is the same. The rhetorical structure of these 22 Chinese sentences is N-S.

Although *aunque* has been translated into different Chinese discourse markers and these Chinese discourse markers show an Antithesis relation, which is different from the Concession relation, we consider that it does not affect readers to understand the information of context. Here we give an example in the UN corpus to explain the situation.

Ex. 3:
Sp: [El objetivo es alentar o servir de inspiración a los ciudadanos para que presten servicios voluntarios,]EDU_N [aunque la decisión queda en manos de la persona o la organización.]EDU_S
Ch: [鼓励或激励公民志愿服务，]EDU_N [但让个人或组织自己做出选择。]EDU_S
En: The goal is to encourage or inspire citizens to volunteer, although the decision is in the hands of the person or organization.

In this example we can see that, the Spanish passage holds a N-S rhetorical structure of the Concession relation while the Chinese passage holds the same rhetorical structure in the Antithesis relation. Merely, the main idea of these two passages is the same, which is to offer services voluntarily and let the person or the organization to choose by their own.

2) The translation of *aunque* represents another RST relation in 15 Chinese sentences, which is a multinuclear relation (N-N) known as List.

There are few occasions in the UN corpus where *aunque* has been translated into “tongshi” (同时), which in Chinese means *at the same time*. The selected example of the translated Chinese discourse marker “tongshi” (同时) in the UN corpus is the following:

Ex. 4:
Sp: [Acoge complacida el progreso logrado en la rehabilitación de escuelas, el suministro y la distribución de material didáctico y la capacitación de maestros,]EDU_N [aunque subraya la necesidad de fomentar la capacitación.]EDU_S
Ch: [欢迎学校在修复、教材供应和分配以及教师培训方面取得进展，]EDU_N [同时强调需要能力建设。]EDU_N
En: Welcomes the progress made in the rehabilitation of schools, provision and distribution of educational materials and teacher training, **while** emphasizing the need for capacity building.

In example 4, we can see that the Spanish passage uses *aunque* to show a Concession
relation but the Chinese passage uses “tongshi” (同时) (‘meanwhile’ in English), a multinuclear relation (List) to deliver the information. In the Spanish passage, the highlighting part is the first EDU; the second EDU is the additional information of the first EDU. In the Chinese passage, both EDUs are same important. Though the rhetorical structures (discourse relations and the nuclearity order) between the two passages are different, they all show the same basic information. This shows that, though there are improvements in schools, still the need for capacity building should be emphasized.

3) There are 2 translated Chinese sentences that do not contain the translation of aunque. Example 5 shows one of these cases.

Ex. 5:
Sp: [Reconoce que, aunque las medidas adoptadas para aplicar los resultados de las grandes cumbres y conferencias y los períodos extraordinarios de sesiones de las Naciones Unidas en las esferas económica y social y esferas conexas celebrados durante los últimos diez años servirán para promover el desarrollo social]EDU_S [también será necesario contar con una cooperación y una asistencia para el desarrollo más intensas y eficaces en los planes internacional y regional y avanzar hacia una mayor participación, justicia social y equidad en las sociedades]EDU_N

Ch: [认为过去十年间在经济、社会和有关领域举行的联合国各次主要的首脑会议、会议和特别会议的成果而采取的行动将进一步促进社会发展]EDU_N [但]也必须加强和有效开展国际和区域合作与发展援助，逐步扩大参与，加强社会正义和增进社会公平。]EDU_S

En: Recognizes that, although the measures taken to implement the outcomes of the major summits and conferences and special sessions of the United Nations in the economic, social and related fields held during the past ten years will further promote social development, also it is necessary to depend on the cooperation and assistance for more strengthened and effective development in the international level and regional, and move towards to a greater participation, social justice and equality in societies.

In the Spanish passage, the discourse marker aunque shows a Concession relation. The marker también (‘also’ in English) is included in the sentence too. The Chinese passage just translates the discourse marker “también” as “dan” (但). Although the Spanish passage and the Chinese passage both hold a Nucleus-Satellite (N-S) relation, the rhetorical relation is different. A Condition relation (S-N) is held between two Spanish sentences while the Chinese parallel sentences have an Antithesis relation. This means that in Spanish the emphasised part (nuclear span of relation) is the second EDU, whereas in Chinese the opposite occurs.

Table 3 includes the discourse structures in Chinese detected in our corpus equivalent to the sentences in Spanish including the discourse marker aunque (that is, showing a Concession relation). This table could be used by Spanish-Chinese human translators and could be useful for MT researchers. When translating the Spanish discourse marker aunque to Chinese, for showing a Concession relation, they could follow the rules included in table 3.

Table 3. Chinese discourse structures equivalent to Spanish discourse structures including the discourse marker aunque

5 Conclusion and Future Work

In this work, we have explored the sentences that contain the Spanish discourse marker aunque and their Chinese parallel sentences in
In the Spanish subcorpus, aunque shows the Concession relation. However, in the Chinese subcorpus, this marker has many different Chinese discourse markers, and these Chinese discourse markers hold different RST relations. Besides, in some parallel sentences, there is no translation of aunque.

The original language of the official documents in the UN corpus is English. The parallel corpus is translated from English, so the parallel corpus Spanish-Chinese is actually made up of two parts. One is the translation between English and Spanish, and the other is the translation between English and Chinese. These translated Spanish and Chinese documents make up the UN Spanish-Chinese parallel corpus. The UN parallel Spanish-Chinese corpus is not a direct translation corpus. Therefore, due to the linguistic realization (normally known as translation strategy) a Spanish discourse marker could be translated to different discourse markers in its parallel Chinese corpus. Also for a same sentence, nuclearity order and the number of discourse markers between these two languages could be different. In the 86 analysed sentences, the rhetorical structure between Spanish and Chinese is quite similar. This means that the rhetorical structure has been changed when doing the translation work. We think this explains why the Spanish discourse marker aunque has been translated to different Chinese discourse markers and why it has not been translated in only a few instances.

In this work we have only analysed the structure of independent sentences, which means we just analyse intra-sentence discourse segments and, therefore, the discourse structure between Spanish and Chinese is similar. If we analyse a whole text, more discourse differences between this language pair would appear.

This research is a corpus-based preliminary study. For our future work, we will use a larger Spanish-Chinese parallel corpus and compare their nucleus-satellite order to find more discourse similarities and differences in order to provide discourse information for the translation between this language pair.
